Individual Contribution

Diego Chidiac (40315295)

For Sprint 2, I was responsible for the backend of three user stories: job posting management (US-04), job application submission (US-06) and application status tracking (US-07). For US-04, I designed the Job database model, with constraints on the job type and salary range, and implemented seven FastAPI endpoints that let recruiters create, list, view, edit, close, reopen and delete their postings, all protected by a shared ownership check. For US-06, I designed the Application model, where a unique constraint prevents a job seeker from applying twice to the same job, and implemented the endpoints to submit an application with a selected or primary resume and to list a job seeker's own applications. For US-07, I implemented the endpoint that lets only the posting's recruiter update an application's status, a status history table that records every change with its timestamp, and the endpoint listing the applicants for a posting, which the recruiter screen uses. I wrote 85 automated tests for these features, which run in our CI pipeline on every pull request. I also documented my AI usage in my Sprint 2 AI log.
