Sprint #2

For this sprint, I was responsible for the Profile Management feature and the project's CI pipeline. On the Profile Management side, I built a profile system for job seekers. It includes a FastAPI profile API, a Profile database model with skills, education and experience, input validation, and a profile completeness score that tells users which sections are still missing. I also implemented resume management in the Profile tab (replacing a resume, choosing a primary one, and automatically promoting another when the primary is deleted) and profile photo upload for both job seekers and recruiters. The photo upload checks the real file type and size and stores one file per user. On the frontend, I created a retractable sidebar with a Job Dashboard tab and a Profile tab, designed so future tabs can be added by adding a single entry. For CI, I set up a GitHub Actions workflow that runs on every pull request and push to main. It lints, type-checks and builds the frontend, lints the backend, and runs the acceptance tests on a throwaway PostgreSQL database. There is at least one acceptance test per main user story feature: registration and login, resume upload and management, and profile management. Each feature runs as its own job, and a single "CI gate" check is required before merging. New features get their own check just by adding a test file, and the run summary shows which test verified which user story. I used AI assistance for design and implementation, then reviewed, tested and validated the results myself, as recorded in the AI log.
