For Sprint 1, I was responsible for the backend of the resume upload feature. I designed the Resume database model, with a foreign key linking each resume to its owner, and the Pydantic schemas that define what the API returns. I implemented four FastAPI endpoints to upload, list, download and delete resumes. The upload endpoint validates the file type (PDF or DOCX) and gives a 5 MB size limit. It stores each file on disk under a randomly generated UUID name, which prevents naming collisions and keeps the user's filenames out of server paths in our PostgreSQL database. I also wrote a shared ownership check used by both the download and delete endpoints, so users can only access their own resumes. I integrated my routes with the team's authentication, and my endpoints are the ones the dashboard's resume section calls. I also took part in both sprint meetings and documented my AI usage in my Sprint 1 AI log.
