Sprint 1:

I took care of generating 10 user stories using AI, validated them against the guidelines, and logged the task in my personal AI log. Then, as a team, we discussed these user stories and brainstormed our own team user stories. I added the user stories to the GitHub project (US-01 to US-10 are AI generated, US-11 to US-16 are team generated), with the user stories as main issues and their tasks (three per user story) as sub-issues. Each user story is assigned a label indicating its priority level and whether it was AI or team generated. I also created a work plan using Google Sheets.
