Sprint 2:

I implemented US-05 (Job search and filtering). On the frontend, I defined the job interface and first built styled job listing cards from sample data (Task 5.3). I then added a work mode field to the job posts on the backend and matched the frontend type to the schema. I built the job search API endpoint (`GET /api/jobs`) with keyword search and filters for location, category, job type, and work mode (Task 5.1), and added database indexes for the search fields (Task 5.2). I connected the job dashboard to the search API, with filters and an expandable detail view showing the full job description (Tasks 5.3, 5.4), and created backend tests for the search endpoint.

I generated acceptance tests using a template for the user stories for Sprints 1 and 2, with a clear `acceptance test` tag and linked to their respective user stories as sub-issues. I then updated the work plan with new tasks and the acceptance tests.
