

AI Exercise - Sprint 1: Team Features and User Stories

Part 1: AI Generated User stories

Generated by Ismail Cherfaoui with Claude Opus 5.5 (High): <https://claude.ai/share/1fa29e2e-29fd-4e3e-8257-9f5f1f0984f7>

Logged as Task 1.1 in [Sprint 1/AI_Log/Ismail/AI-Log-Sp1-Ismail-Cherfaoui.pdf](#)

GitHub: Issues US-01 to US-10, label "ai-generated"

10 AI Generated User Stories:

US-01: Account registration and login

As a job seeker, I want to create an account and log in securely so that I can access platform features and keep my job search data private.

- Priority: High
- Task 1.1: Design database schema for user account data, including a role field (job seeker/recruiter).
- Task 1.2: Implement authentication API (signup, login, logout endpoints with password hashing and session/token handling).
- Task 1.3: Build registration and login UI forms with input validation and error messages.

US-02: Job seeker profile management

As a job seeker, I want to create and edit my profile so that recruiters can see my background, skills, and contact information.

- Priority: Medium
- Task 2.1: Design database schema for profile data (education, experience, skills, contact info).
- Task 2.2: Implement profile API endpoints (create, read, update).
- Task 2.3: Build profile view and edit pages in the UI.

US-03: Resume upload and management

As a job seeker, I want to upload, replace, and delete my resumes so that I can keep up-to-date versions ready for different applications.

- Priority: High
- Task 3.1: Set up file storage and define accepted formats and size limits (e.g. PDF, DOCX).
- Task 3.2: Implement resume API endpoints (upload, list, download, delete) linked to the user account.
- Task 3.3: Build resume management UI showing uploaded files with upload date and actions.

US-04: Job posting management

As a recruiter, I want to create, edit, and close job postings so that job seekers can find and apply to my open positions.

- Priority: High
- Task 4.1: Design database schema for job postings (title, company, location, type, description, deadline, status).
- Task 4.2: Implement job posting API endpoints (create, update, close, delete) restricted to recruiter accounts.
- Task 4.3: Build recruiter UI for managing postings (form and list of the recruiter's own postings).

US-05: Job search and filtering

As a job seeker, I want to search for jobs by keyword and filter by location, job type, and posting date so that I can quickly find opportunities relevant to me.

- Priority: High
- Task 5.1: Implement search API endpoint with keyword matching and filter/query parameters.
- Task 5.2: Add database indexing on commonly searched fields to keep queries fast.
- Task 5.3: Build search page UI with search bar, filter controls, and paginated results.

US-06: Job application submission

As a job seeker, I want to apply to a job posting by selecting one of my resumes so that I can submit applications directly through the platform.

- Priority: High
- Task 6.1: Design database schema for applications (job, applicant, selected resume, submission date, status).
- Task 6.2: Implement application submission API endpoint, preventing duplicate applications to the same posting.
- Task 6.3: Build apply flow in the UI (resume selection, confirmation, success message).

US-07: Application status updates

As a recruiter, I want to update the status of each application (Applied, Interview, Offered, Rejected) so that applicants know where they stand in the hiring process.

- Priority: Medium
- Task 7.1: Implement API endpoint for updating application status, restricted to the recruiter who owns the posting.
- Task 7.2: Build recruiter UI listing applicants per posting with a status selector.
- Task 7.3: Record status change history with timestamps.

US-08: Application history dashboard

As a job seeker, I want a dashboard showing all my submitted applications and their current status so that I can track my progress in one place.

- Priority: Medium
- Task 8.1: Implement API endpoint returning the user's applications with job details and current status.
- Task 8.2: Build dashboard UI with application list, status indicators, and sorting/filtering by status.
- Task 8.3: Add summary counts per status (e.g. number of interviews, offers).

US-09: Deadline notifications and reminders

As a job seeker, I want to receive reminders before application deadlines of jobs I'm interested in so that I don't miss opportunities.

- Priority: Low
- Task 9.1: Design notification data model (recipient, type, message, read/unread, date).
- Task 9.2: Implement scheduled job that generates reminders for upcoming deadlines of saved jobs.
- Task 9.3: Build in-app notification panel with unread indicator and mark-as-read action.

US-10: Saved jobs and favourites

As a job seeker, I want to save job postings to a favourites list so that I can revisit and apply to them later.

- Priority: Low
- Task 10.1: Design database schema linking users to saved job postings.
- Task 10.2: Implement API endpoints to save, unsave, and list saved jobs.
- Task 10.3: Add save/unsave button to job listings and build a saved jobs page.

Part 2: Team Generated User Stories and Features

GitHub: US-11 to US-16, label "team-generated"

6 Team Generated User Stories

US-11: AI job study partner

As a job seeker, I want to chat with an AI "study partner" about a job posting so that I can prepare for its required skills and possible interviews.

- Priority: High
- Task 11.1: Set up the AI API connection and define the output
- Task 11.2: Build the backend endpoint that sends the job posting and the conversation to the AI model
- Task 11.3: Build the chatbox UI

US-12: FutureSearch qualifications highlighting

As a job seeker, I want postings to be marked in green or red depending on if I meet requirements, and if I am missing requirements to know what they are and how to obtain them (e.g. certifications, technologies, etc)

- Priority: Medium
- Task 12.1: Add structured requirements field to posting and matching fields to the profile
- Task 12.2: Implement logic that checks user profile and compares it to the job posting and highlights missing requirements (if applicable)
- Task 12.3: Implement green and red highlighting in the search UI and a way to view/list missing requirements if applicable

US-13: Signing in with third party accounts

As a job seeker or recruiter, I want a way to sign in with my existing accounts (Google, GitHub, iCloud, etc., TBD) so that I don't need to remember another account and password.

- Priority: Low
- Task 13.1: Configure the sign-in credentials for the services
- Task 13.2: Implement the sign-in connections on the backend
- Task 13.3: Add in the "Sign-in with [service]" button(s) to the login and registration screen

US-14: Password reset system

As a job seeker or recruiter, I want to be able to reset my password with a code sent to my email so that I can recover my account if I forget it.

- Priority: Medium
- Task 14.1: Setup an emailing system that sends a code to the user
- Task 14.2: Implement the backend support for a password reset system (generates code, sends and verifies the code) that allows the user to access the password change page
- Task 14.3: Build the "Forgot password", "Enter code" and the password reset page/UI

US-15: AI cover letter generator

As a job seeker, I want to generate a cover letter from my resume and a job posting so that I can apply faster with a custom and tailored cover letter.

- Priority: Low
- Task 15.1: Design the cover letter template/structure and the sent AI prompt
- Task 15.2: Implement the backend, sends the job listing and resume to generate the cover letter
- Task 15.3: Build the UI to generate, edit, and download the cover letter

US-16: AI resume feedback

As a job seeker, I want suggestions for what improvements I can make to my resume content.

- Priority: High
- Task 16.1: Connect the AI API and implement resume parsing (.pdf, .docx, etc)
- Task 16.2: Implement the backend that generates the query with the resume content
- Task 16.3: Build the UI to review and apply suggestions or modifications to the resume

Part 3: Team Decisions

We decided to keep all the AI generated user stories (US-01 to US-10). We found that the generated issues and sub-issues were satisfactory and followed the sprint 1 guidelines document. After discussing as a team, we brainstormed six additional user stories (US-11 to US-16) that the AI did not suggest.
