Individual Contribution

Ethan Fadlon (40314189)

For Sprint 2, I was responsible for Task 6.3 of the job application submission feature (US-06), which lets a job seeker apply to a job posting by selecting one of their resumes. I also helped start the design of US-06. I designed and implemented the apply flow in the UI: the user chooses one of their resumes from a Select menu, the Apply button becomes available once a resume is chosen, the user confirms the application in a dialog, and a success message is shown. This is the part of the feature that users see and use, and it connects the interface to the application submission work built by my teammates. Beyond this task, I added a Light, Dark and System theme toggle so the whole app follows the appearance the user prefers. I also reviewed the front end as a whole, made a couple of UI design changes, and suggested improvements to the team, such as better colour contrast and accessibility, consistent spacing and button styles, loading and error states, and a more responsive layout. I was also in charge of documentation for meetings and communication for this sprint.
